Recycling filter Washout Booth

A unit for ink removal and degreasing with an integrated recycling and filter system

simplicity in performance

No volatile **solvents anymore**

With using the INPRO safest inkt removal products you can minimize the consumption of ghost-images products, degre-aser and volatile solvents.

Quick **ROI**

Are you looking for a simple and lower budget solution, then the InPro Recycling Washout booth is the answer for you. Just plug&play ,simple to connect on compressed air, no power needed.

Higher **Quality**

This easy to use and maintain stainless washout booth includes an automatic filter and recycling system for a longer lasting high quality of the safe ink remover.

INPRO

Recycling filter Washout booth

This Recycling washout booth offers:

- screen printer can start faster with the next job
- safer working conditions for all people
- no extra costs for the air circulation system, towels and solvents that are used
- minimized risk of dried inks and ghost images
- higher quality of re-used screens
- less time spend in cleaning and reclaiming the screens with less (dangerous) chemicals products and with a higher quality.
- stainless steel washout booth with high quality parts and filter system
- simple to change a filter
- simple to keep the product in good working conditions
- long lasting high flashpoint special InPro chemicals
- minimized consumption of the product
- easy to combine with the Combi-eco system for fully automation of all the water rinse in pre-post press.
- plug&play , so simple to connect on compressed air , no power needed

In general when a production is finished, the screenprinter wraps out the ink and often cleans the image with a volatile solvent and puts the screen aside. Later the operator will come and clean and reclaim the screen in the cleaning room.

This way of working has the following results:
- Time consuming for the screenprinter: the next job could start direct after wrapping out the ink
- Volatile solvents on the press: solvents vaporized in the air bring extra costs for the air circulation system, first you bring solvents in the air and then this air must be cleaned
- The volatile solvents used for wraping out the ink are only used once and create extra costs
- Towels to clean the image can be expensive
- With these towels maybe 80% of the ink is removed . When only the ink is removed and the screen is put on stock for re-use you can have rest inks.
- These rest inks can become your ghostimage which influences the print quality.
- By putting the screens aside after cleaning on the press the image, ghost images are created which must be cleaned with a dangerous and corrosive activator and ghost image remover, that can also damage the mesh.

This all leads to extra work hours, extra costs , unsafe situations and not to a constant quality.

InPro has the solution !

InPro Recycling filter Washout booth

You put the screen in the InPro special washout booth and brush the ink with a high flashpoint and safe InPro ink remover till the ink is removed. The INPRO Washout Booth offers a solution to clean and degrease your inks and includes an automatic filter and recycling system that enables a longer lasting quality of the ink remiover, without using dangerous solvents. Furthermore you can use the chemicals many-times again for achieving high quality cleaned screens. In the end this reduces working hours, extra costs with safer working conditions and a higher constant quality.

After the ink is removed you can wash out the screen with your manual highpressure water unit .
We offer the Combi-eco for a fully automatic high and low pressure water rinse, for the safest and high quality washout and developing of your screens. Please ask for the Combi-eco leaflet.

Next to the washout booth InPro offers modulair in-line systems for fully automatic inkremoval, degreasing, decoating, drying , de-ghosting and developing. Please ask for info on the Tigerclean series.
